Empowering client and family to take charge of their own health to reduce unplanned admission

NC Kee Mong Nee; APN/NC Gat Peijing; Dr Julinda Concepcion Cabigon Tabiolo, Changi General Hospital

Singapore Healthcare Management 2019

Background
Mr T is a 47 years old gentleman, married with no children. He is chair bound and requires assistance in his Activities of Daily Living (ADLs) due to a recent stroke. He has been admitted multiple times since then.

Methodology
Mrs T was engaged through 1 to 1 interviews conducted during home visits. The nurse worked with Mrs T to identify the causes of readmissions and designed a plan to prevent avoidable admissions in partnership with Mrs T (Diagram 1).

Aim
1. To empower Mrs T in decision-making during crisis periods
2. To increase Mrs T’s confidence in managing “Esther’s” condition
3. To decrease unplanned visit to ED

Proposed Solution
To empower Mrs T in her decision making, the home team focuses on addressing her gaps in knowledge by conducting a family conference. In consultation with the team physician, an individualized escalation guideline was developed so that Mrs T has clear instructions to aid her decision-making (Table 2). Caregiver’s training was done to ensure that she is capable of performing interventions stated in the guideline.

Acknowledging that time is needed for Mrs T to build her confidence in managing these clinical situations, the Home Team continued to support her with their clinical expertise during the care episodes.

Outcome
After intervention, Esther’s wife managed to handle 3 crisis at home without any ED visit and there is NO admission from Sept 2017 to Nov 2017.

Learning Point
In the community, while the competency of the home care team is important, the ability to motivate and empower Esther as well as their families to take responsibility over their health is even more essential. This can come in the form of clear instructions and support.

It is only through empowerment that Esther and their families can gain confidence and continue the care of their loved ones in the community. As such, the act of empowering the Esther and family to take charge of their health is the best strategy for long-term management of chronic conditions and decreasing unnecessary stress from avoidable admissions.

Table 2: Escalation Guideline

- Wife managed to initiate PR Bisacodyl insertion when patient BNO for 1 day
- Patient developed low-grade fever. Antibiotic was given for standby and advised wife to serve if temperature was more than 38 degrees Celsius.
- Wife initiated Augmentin when temperature spike more than 38 degrees Celsius.
